

Description: Description of all examples included in Pocket GENESIS v7.0

OS Requirement: Pocket PC operating systems on Strong ARM or MIPS processors

General Requirement: Pocket GENESIS must be installed on the Pocket PC, but connectivity is not required for these offline demo files. There are no examples for Pocket AlarmWorX because there are no demo alarms generated by Pocket AlarmWorX.

Configuring for Offline DemoMode

When conducting a demonstration for Pocket GENESIS, the example files that are included in the installation can be run without connecting to any remote servers. The first step in running an offline demo for Pocket PC is to configure the Pocket GenBroker settings for “Offline DemoMode”. Do this by opening the Pocket GenBroker Configurator from the programs menu, and checking the “Offline DemoMode” checkbox. Then press the OK button to apply the changes.

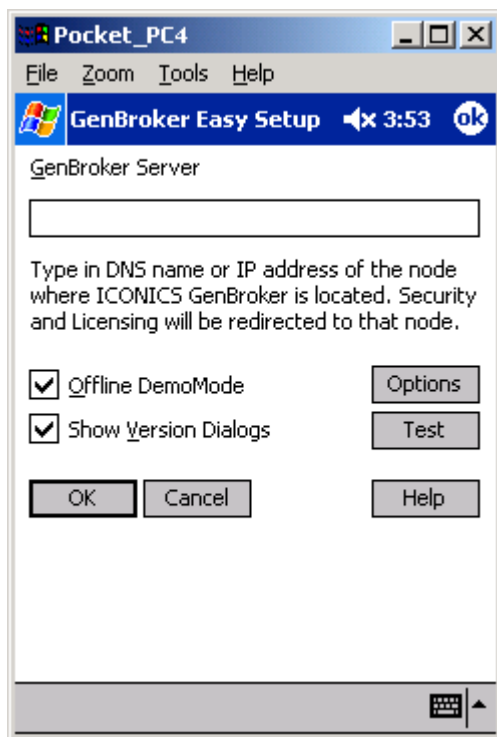

Figure 1 GenBroker DemoMode Configuration

Display_01.gdc, Display_02.gdc, Display_03.gdc, ..., Display_06.gdc, LanguageSample.gdc, Display_05_landscape, and Display_04_landscape.

The Display_01 ... 06 files all use local simulated variables and are designed to show the basic functionality of GraphWorX.

The two landscape files are designed to be viewed after the screen has been rotated to the left or right, using the Pocket Screen Rotator Utility. In Pocket AlarmWorX and TrendWorX you do not need to specially configure files for landscape mode such as these.

The LanguageSample display demonstrates the use of language aliasing in Pocket GraphWorX, and will only work if you first load the sample language database into the Language Settings application.

Pocket TrendWorX Examples

The following files are included as examples for Pocket TrendWorX:

Example.tce, Example_Det.tce, Example_Strip.tce, Example_Strip_Det.tce, and LanguageExample.tce

These example files use local simulated variables to show examples of chart and strip charts with and without details shown. There is also an example of using language aliasing in Pocket TrendWorX, which requires Language Settings to be configured.

Language Settings

The Pocket Language Settings application contains a default language database that enables the GraphWorX and TrendWorX language demo files to work. The name of the file is “LangSupSample.xml” and it contains most of the language strings that are included in GENESIS-32. To load this file, simply open the Language Settings application from the Start/Programs menu, and browse for the file under “Language File Path”. Then press the **Configure** button next to the Startup Settings, and select a language. Press OK to apply the changes, and then try using one of the language demo files.

Pocket GraphWorX Examples

The following is a list of the examples that are included with Pocket GraphWorX:
